

The constitution allows congress to establish a monopoly for intellectual property for a "limited time". This clearly implies that at some point in time, something that is protected under copyright will move to a status of not being protected.

What mechanism does this technology employ to ensure that the intent of the constitution is met? How does the information know when to expire the "do not allow copying" flag.

It would seem to me that any technology that falsely marks unprotected material as protected, at any point in time, is flawed from a technology standpoint and illegal from a constitutionality standpoint.

Thank you for your consideration in this matter.
